- 1. How does thread creation differ from process creation in terms of resource requirements?
- 2. What kind of program in which multithreading does not provide better performance than a single-threaded solution?
- 3. Can a multithreaded solution using multiple kernel-level threads provide better performance than a single-threaded solution on a single-processor system?
- 4. What would be the output from the following programs? In program A, the thread is created in the "if" clause. In Program B, the thread is created in the "else" clause.

```
#include <pthread.h>
#include <stdio.h>
#include <unistd.h>
#include <sys/wait.h>
     value=0;
int
void *runner(void *param) {
     value = 5;
     pthread_exit(NULL);
}
int main(int argc, char *argv[])
{
     pid_t
                pid;
     pthread_t tid;
     pid=fork();
     if (pid>0) {
           /* Code segment for Program A
           pthread_create(&tid, NULL, runner, NULL);
           pthread_join(tid, NULL); */
           wait(NULL);
           printf("%d ", value);
     }
     else {
           /* Code segment for Program B
           pthread_create(&tid, NULL, runner, NULL);
           pthread_join(tid, NULL); */
           printf("%d ", value);
     pthread exit(NULL);
}
```

Self-test

1. allocat	In a multithreaded environment, a is defined as the unit of resource ion and a unit of protection.
Α.	thread
B.	process
C.	lightweight process
D.	trace
2.	A is a single execution path with an execution stack, processor state, and
schedu	lling information.
A.	domain
B.	trace
C.	thread
D.	message
3.	Which of the following is a benefit of threads?
A.	Takes less time to create a new thread than a process
B.	Enhances efficiency in communication
C.	Takes less time to switch between threads than processes
D.	All of the above
4.	Which of the following states is not a state for thread?
A.	Running
B.	Suspend
C.	Ready
D.	Blocked
5.	A is created by invoking an application-level function in the threads library
and the	e kernel is not aware of its existence.
A.	Kernel
B.	KLT
C.	lightweight process
D.	ULT
6.	The principal disadvantage of the approach is that the transfer of control
from o	ne thread to another within the same process requires a mode switch to the kernel.
A.	KLT
B.	API
C.	VAX
D.	ULT
